

DEC 02 1999

MR. MILLER: My name is Matt Miller.

I understand that there are 33 faults that go through the nuclear repository, and I was -- and I had a friend that worked at a nuclear test area, a nuclear facility down in California and was exposed to radiation numerous times because of unsafe tests. The cancer came up very recently, and it passed through his body in less than four months, and then he passed away. His name is Mack Olsen. And he impacted a lot of people in Carson City.

1 Also [I was hoping that you could look at other sites other than Yucca Mountain that would be safer because the nuclear waste will get into the ground water, and it could flow into some counties of California. So I hope you can find better sites that are more equipped for the needs of this.] Thank you.
