1 Comments: How much money was already paid by the consumers every month, from decades ago, by the nuclear waste disposal component included in everybody's electric rates? That component was supposed to be used by the DOE to investigate appropriate sites for permanent repositories of nuclear waste. Of course, the selection is the easy way out, Nevada.

It is amazing to see that after all this time and after all the money that was put into the project, the DOE has not been able to find a better way to dispose of nuclear waste. And, better yet, for a country like ours who has put people in the moon and has lived through a fantastic 20th century, as far as scientific advances is concerned, it is amazing to see that we have not been able to find an alternate safe means of generation.

2 Radiation stays radioactive for thousands of years and it leaks from almost every place. We should learn from some countries in the world who are trying to close nuclear plants and replace them by other safe means of generation. I know, this is not a smart business decision! Nuclear power is clean and cheap, but not safe. If there is something which is even more offending than ignorance in this subject matter, that something is greed.
