Yucca Mountain

The debate of whether or not to deposit nuclear waste at the Yucca Mountain site is one that is very heated and has incredibly strong arguments to lead people to one side or another. The answer is not to dump the waste at the Yucca Mountain site. Of course, the ideal solution would be to send the nuclear waste into outer space so it never has to affect people on earth again. This may be a risky thing to do, though, because the rocket may explode while taking off, causing a mass dispersal of nuclear waste all over our planet. After omitting this option, the best idea would be to bury the waste in the earth, following a plan close to the Yucca Mountain proposal. The location of this underground site would be the part of the proposal to change. [The underground waste repository should be built near a very poor area. If this is done, a new world of jobs would open up to the people who so desperately need them. That would increase the general wealth of an area, which may reduce things such as crime.]

Respectfully Submitted,
